🎓 | Education

- 09/2024 - 07/2026 ○ **Master's Degree in Cyber Security, University of Milan, (Milan, IT)**
Thesis: "Design and Implementation of an API-Agnostic Tool for REST API Security Assurance"
Supervisors: Marco Anisetti, Claudio Agostino Ardagna
Expected Graduation: 07/2026
- 09/2021 - 10/2024 ○ **Bachelor's Degree in System and Network Security, University of Milan, (Milan, IT)**
Thesis: "Design and Implementation of a Framework for Evaluating Distributed System"
Supervisors: Marco Anisetti, Filippo Berto
Final Grade: 110/110 cum laude
- 09/2016 - 06/2021 ○ **High School Diploma in Computer Science, IIS Badoni, (Lecco, IT)**
Final Grade: 93/100

🏢 | Work & Research Experience

- 12/2025 - 07/2026 ○ **Curricular Internship for Master's Thesis, SESAR Lab, University of Milan, (Milan, IT)**
Secure Service-oriented Architectures Research Lab (SESAR Lab)
- Designed and implemented **APIGuard Assurance**, an **API-agnostic, contract-driven** tool for REST API security assurance, deriving target knowledge from the **OpenAPI Specification (OAS)** and a deployment configuration, with no hardcoded references to any system.
 - Organized security checks into a taxonomy of eight domains, aligned with the NIST SP 800-228 guidelines for API security, structuring assessment coverage by risk category.
 - Designed *specified oracles*, evaluation criteria derived from the domain-specific knowledge of each security control, to automatically assess violations, traceable to **OWASP** categories and **CWE** codes.
 - Implemented a **deterministic assessment engine** based on a **DAG scheduler** to resolve dependencies between checks, exposing **semantic exit codes** for **CI/CD** integration.
 - Validated the tool against a real-world target, **Forgejo** exposed through the **Kong** API gateway, confirming correct detection of security violations and deterministic, reproducible results.
- 03/2024 - 09/2024 ○ **Curricular Internship for Bachelor's Thesis, SESAR Lab, University of Milan, (Milan, IT)**
Secure Service-oriented Architectures Research Lab (SESAR Lab)
- Analyzed existing verification and monitoring solutions in distributed environments and contributed to the design and implementation of the Assurance Engine (a **Rust**-based assurance framework for distributed systems deployed on **Kubernetes**)
 - Extended the existing framework to enable integration with **Elasticsearch**, used as the backend for data collection and querying.
 - Developed and tested **formal** contracts, based on metrics, for the automated verification of **non-functional properties (NFP)** – including the **CIA triad**, **reliability**, **scalability**, and **performance** in distributed and microservices architectures.
 - Implemented **REST APIs** to expose the engine's functionalities.
- 01/2020 - 02/2020 ○ **WBL: web developer, DaTriK Solutions, (Casargo, IT)**
High school work-based-learning
- Work Based Learning (WBL): development of a web application.
 - Technologies used: **HTML**, **JavaScript**, **jQuery**

| Projects

- APIGuard Assurance – An API-Agnostic Tool for REST API Security Assurance** *Master's Thesis Project (A.Y. 2025/2026)*
A security assessment tool for REST APIs exposed through API gateways, designed to detect semantic vulnerabilities that traditional syntax-based scanners miss, by deriving all target knowledge directly from the OpenAPI Specification.
- Built in **Python 3.12** with **Pydantic** models for runtime data validation and a plugin-style test-discovery mechanism, allowing new security checks to be added without modifying the core engine.
 - Verified the engine's own reliability before trusting its security verdicts, enforcing strict static typing (**mypy**) and automated quality scanning (**ruff**, **bandit**, **vulture**, **pip-audit**) to achieve full docstring coverage on the public API.
 - Packaged with **Hatch**, verifying byte-reproducible builds (identical SHA-256 wheel hash across runs) and isolating an **AGPL-licensed** dependency behind an optional install extra to keep the core package free of copyleft propagation.
 - Integrated external security scanners (**nuclei**, **testssl.sh**, **sslyze**) through a hierarchical connector architecture, keeping the core test logic decoupled from how each external tool's output is parsed.
- Event-Driven IoT Microservices Architecture (Kafka + Kong)** *Cloud Computing Technologies Course Project (A.Y. 2025/2026)*
Development of a cloud-native Kubernetes infrastructure for IoT ingestion and monitoring, with a particular focus on **non-functional properties** such as scalability, fault tolerance, and edge-to-core security.
- Microservices architecture based on **Apache Kafka** in KRaft mode (ZooKeeper-less) for asynchronous decoupling and reliable message handling (*Zero Data Loss*).
 - Integration of **Kong API Gateway** to implement the *Gateway Offloading* pattern, centralizing Authentication (API Key), Rate Limiting, and Load Balancing at the edge.
 - Storage layer optimized on **MongoDB** using **Time Series Collections** and hybrid compression (LZ4/Zstd) to maximize storage efficiency and analytical performance.
 - Full **Kubernetes** orchestration managed via **Helm**, featuring automatic scalability (HPA) and advanced security (Secrets, TLS/SASL) to meet non-functional requirements.
- FTP Client and Server** *Computer Networks Course Project (A.Y. 2022-2023)*
Developed a multi-threaded **FTP-compliant** client-server application in **C** for file transfer, fully interoperable with **FileZilla**.
- Architecture: Multi-threaded server based on **Socket Programming** for concurrent session management.
 - Data Modes: Native support for both Active (PORT) and Passive (PASV) data transfer modes.
 - Protocol Management: Implemented essential *FTP commands* (e.g., USER, PASS, LIST, RETR, STOR, CWD...)
 - **Key skills: C, socket programming, multithreading, network protocols, FTP, Git.**
- Exhibition Web App** *Web and Mobile Programming Course Project (A.Y. 2021-2022)*
Built a dynamic web application serving as a digital portfolio for displaying multimedia content.
- Developed the backend with *Node.js/Express* and the frontend with *HTML5, CSS3, JavaScript/jQuery*.
 - Integrated *MongoDB* for document-oriented storage and *AJAX* for asynchronous client-server communication (GET, POST, DELETE).
 - Managed source code and collaboration using **Git** and **GitHub**.
 - **Key skills: Node.js, Express, MongoDB, AJAX, REST APIs, jQuery, Git.**

| Publications

TODO: exact title Enea Manzi, Marco Anisetti, Claudio A. Ardagna
ITADATA 2026 (submitted)
TODO: draft below, to refine

| Languages

Italian Mother tongue
English Intermediate *Listening B2 - Reading B2 - Writing B2 - Spoken Production B2 - Spoken Interaction B2*

| Skills

Programming Languages	<i>C, Java, Python, SQL, Web (HTML, JavaScript/Node.js), OOP Concepts, low-level programming</i>
Database	<i>MySQL, Database Design, Implementation and Administration</i>
Architectures & Software	<i>Docker, Kubernetes, microservices architectures, REST API, Git, Kafka, Kong API Gateway</i>
Operating Systems	<i>Fresh OS installation, Linux Administration and Shell, Windows</i>
Networking & Security	<i>Network Protocols, ICT Network Security Risk, Secure Coding Practices</i>
Tools	<i>Visual Studio Code, GitHub</i>

| Soft Skills

Thinking	<i>analytically, critically, proactively</i>
Problems	<i>address problems critically, solve problems/create solutions</i>
Communication	<i>cooperate with colleagues, work in teams, manage teamwork</i>
Others	<i>demonstrate curiosity, cope with stress, prioritise tasks</i>
